

VideoStudio Pro X4 X5 failed to launch with crash error

- VideoStudio

This can be caused by a plug-in installed in your browser and it is called **Browser Manager**. You might not be aware of it since it automatically installs itself in some cases after clicking on a link or you visited some websites. This can be installed in FireFox, Internet Explorer or Google Chrome.

To check if you have one installed, please go to:

For Windows Vista/7:

Click Start > Control Panel > Programs and Features > Look for ?Browser manager? in the list then click on it and click uninstall.

For Windows XP:

Click Start > Control Panel > Add/Remove Programs > Look for ?Browser manager? in the list then click on it and click uninstall.

After uninstalling **Browser Manager**, relaunch VideoStudio.
