

Painter 2015: Layers panel does not update when user floats Canvas

- Painter

Description of problem:

When the canvas is selected and you go to Select > Float, or you click in the center of the document window with the layer adjuster tool, the canvas image should float to its own layer and leave the canvas blank. Currently it is copying the image to another layer, which you would normally do by holding down the alt key when floating.

Workaround:

A Panel refresh is required. Close and relaunch the Layers panel or hide the layer.
