

Motion Title flickers in preview

- Pinnacle Legacy

In some rare cases Motion Titles may appear to flicker during preview. This may occur for a couple of reasons:

1. If background rendering is enabled, wait for background rendering to completely finish. You can check if background rendering is still occurring by the presence of a green bar above the clip in the Timeline.
2. Your graphics card driver may be out of date. We saw this issue in-house with an ATI graphics card, updating to the latest driver resolved this issue. Check with your video card manufacturer's website and see if any newer driver is available.

Note : Please check, your computer may not have the minimum system requirements for Studio 14.
