

AfterShot Pro: closes after splash screen on Fedora Linux

- AfterShot

Problem:

When using Fedora Linux, AfterShot closes after launch or immediately after the default library path is set.
?

Confirmation:

When examining the "~/.AfterShot Pro 3\AfterShotPro.log" file, you see errors regarding libQt5Network.so.5.4.0.
The version number may be different.? Here's how to check the log file:

Open a terminal window and type these commands:

```
$ cd .AfterShot\ Pro\ 3  
$ less AfterShotPro.log
```

Note: less is a text file viewer.? Use your arrow keys to navigate, / to search and q to quit.

?

Resolution:

Open a terminal window and enter the following two commands.? Note that it's OK if openssl-devel isn't found or compat-openssl10 is already installed:

```
$ sudo yum -y remove openssl-devel  
$ sudo yum -y install compat-openssl10
```
